

Calculation of power generation of solar power station

How do you calculate a photovoltaic power station's power output?

To estimate the power generation of a photovoltaic power station simply, you can use the annual solar utilization peak hours to calculate the station's power output. Annual peak solar utilization hours is a measure of the average number of hours of solar energy available in a region during a year. That is, the peak solar time.

How to calculate the output energy of a solar power station?

Next, PVMars will give examples one by one, please follow us! The theoretical output energy (E) of a solar power station can be calculated by the following formula: $E = P_r \times H$
E: Output energy (kWh) Pr: Rated power of the solar energy system (kW), that is, the total power of all photovoltaic modules under standard test conditions (STC)
