

# China's photovoltaic and wind power generation ratio

The Summary summarises the annual statistics of China's energy and power supply and consumption in the previous year, especially the development of wind power and solar PV.

China contributed more than half of the global increase in both solar and wind generation. China is the world's largest electricity consumer, in 2024 accounting for a third of global power demand, and clean ...

China power statistics - April 2025 In the first four months of the year, wind and solar power generation capacity accounted for 89% of new capacity (see Figure 1 below). Solar continued to show significant growth ...

China's goal to achieve carbon (C) neutrality by 2060 requires scaling up photovoltaic (PV) and wind power from 1 to 10-15 PWh year-1 (refs. 1-5).

China is the dominant force in next-generation energy technologies today. It's pouring hundreds of billions of dollars into putting renewable sources like wind and solar on its grid,...

Wind and solar now account for 37% of the total power capacity in the country, an 8% increase from 2022, and widely expected to surpass coal capacity, which is 39% of the total right now, in 2024.

In 2023, China's new energy investment grew rapidly, the investment in solar PV exceeded 670 billion CNY, while the investment in wind power exceeded 380 billion CNY.

China's cumulative installed power generation capacity reached 3.69 billion kilowatts by the end of August, marking a year-on-year increase of 18 percent, official data showed on Friday.

Over the past decade, China has helped reduce the average cost per kilowatt-hour of global wind power projects and PV power generation projects by 60 percent and 80 percent, respectively.

Last year was the second year that China's cumulative installed capacity of renewable energy power generation has exceeded 50 percent of the country's total installed capacity.
