

Europe installed a total 16.4 gigawatt (GW) of new wind power capacity in 2024, down from 18.4 GW achieved in the previous year, according to data by industry association WindEurope. ...

Several European countries experienced wind power capacity growth in 2024. Germany led the way, installing the most new capacity at 4.0 GW, with 82% coming from onshore projects. ...

The research indicates a significant decline in wind power density, estimated at around 15%. This drop could have serious implications for energy production, as Europe has heavily ...

European nations like Spain, France, and Germany are reducing wind generation because their power grids can't absorb excess renewable electricity. When supply exceeds grid capacity, ...

Europe's efforts to expand wind power capacity are falling short of the levels required to meet the European Union's 2030 climate and energy targets, despite wind power providing 20% of ...

Across Europe, we now expect offshore wind installations over the period 2025-2030 to exceed 43 GW, including capacity already connected in H1 2025. This would bring Europe's total installed offshore ...

Europe installed a total of 16.4 GW of new wind power capacity in 2024, of which 84% (13.8 GW) was onshore and the remaining 16% (2.6 GW) was offshore. This represents a decline ...

Some countries in Europe recorded even steeper falls in wind generation this year, including Germany and the United Kingdom, which are Europe's largest wind power producers by...

About The European Electricity Review analyses full-year electricity generation and demand data for 2024 in all EU-27 countries to understand the region's progress in transitioning from ...

This autumn update outlines the latest data for wind energy in Europe and our expectations for the rest of the decade. Europe now has 291 GW of wind power capacity, with 254 ...
