

Engineered for fast installation and maximum corrosion resistance, this solar H bracket is ideal for utility-scale and commercial PV projects, especially in harsh environments such as coastal or desert regions.

This guide provides a detailed comparison between the two most common solar bracket materials: Q235 steel and aluminum alloy, to help you select the optimal solar support bracket for your project.

Our steel PV support structures are strong enough for both roof and ground mount systems that be able to bear the substantial forces of the high wind speeds and panel weights themselves.

Photovoltaic brackets are essential components for securely mounting solar panels, ensuring stable and reliable installations. Designed for durability and precision, these brackets are engineered to withstand various ...

H-shaped steel has wide flanges, thin webs, many specifications and flexible use. It can save 15% to 20% of metal in various truss structures.

Steel H posts are structural beams characterized by a distinctive "H" shape, formed by two vertical flanges and a horizontal web. This robust design gives the posts extraordinary strength and makes them ideal for ...

But what makes steel the go-to material for solar mounting systems? Let's break down the essential types, their unique advantages, and how to choose the right one for your project.

At present, solar steel brackets mainly use lightweight structural steel and small-section ordinary steel structural steel, which can meet the structural requirements of the bracket. At the same time, the weather ...

FarSun solar double-column steel brackets are engineered for durability and stability in solar panel installations. Constructed from high-quality C-steel, these brackets provide robust support for various solar applications.

H-type steel, optimized from I-shaped steel, is economic cross section steel with better cross-section mechanical performance. Especially, it is named because of its letter "H" shape section.
