

How do solar panels convert sunlight into electricity?

The process of converting sunlight into usable electricity involves six key steps: When sunlight hits a solar panel, photons penetrate the anti-reflective coating and enter the silicon photovoltaic cells. Not all photons are absorbed—some reflect off the surface or pass through the material.

How do photovoltaic solar panels generate electricity?

An electric current is created when enough electrons are stimulated. Depending on the material, the frequency necessary to trigger the effect can vary. In photovoltaic solar panels, semiconductors are the photoelectric medium used to convert sunlight to electricity.

What is a photovoltaic cell?

A photovoltaic cell is the most critical part of a solar panel that allows it to convert sunlight into electricity. The two main types of solar cells are monocrystalline and polycrystalline. The “photovoltaic effect” refers to the conversion of solar energy to electrical energy.

How does a photovoltaic cell work?

The photovoltaic effect starts with sunlight striking a photovoltaic cell. Solar cells are made of a semiconductor material, usually silicon, that is treated to allow it to interact with the photons that make up sunlight.
