

How can microgrids help balancing the European Grid?

These microgrids, when successfully connected to the grid, can create a significant bank of flexible capacity for balancing the European grid, enabling the energy transition and unlocking huge amounts of new renewable energy.

Will microgrids take power off the grid by 2027?

On current trajectories, 40% of existing AI data centres will be operationally constrained by power availability by 2027. Microgrids can take this new strain off the grid in the short term and when grid connection is achieved, excess energy generated can be sold.

Can a microgrid power a data centre?

Driven by the rise in artificial intelligence (AI), European data centre power demand is rising steeply, yet access to grid connected power can face delays of up to a decade. Microgrids, comprising of renewable energy, grid balancing engines and energy storage, can provide a reliable, low cost and low emissions way of powering data centres.

Can microgrids help DERs in the electricity market?

Microgrids, however, have the potential to facilitate the integration of DERs in the electricity market (Warneryd et al., 2020). A microgrid is a decentralised grid which can disconnect from the main electricity grid and structure into 'local sub-grids that manage their power and energy balancing' (Pinto et al., 2021).
