

In this paper, we compare several printing and coating methods that are employed to fabricate OPVs, with the main focus towards the deposition of the active layer.

In this context, recent developments of large-scale solution-based methods, encompassing blade coating, slot-die coating, and spray coating are discussed. We also outline the ...

This loss can be mitigated by the use of anti-reflection coatings, which now cover over 90% of commercial modules. This review looks at the field of anti-reflection coatings for solar ...

Our guide breaks down the key differences between roll-to-roll, sheet, and hybrid systems, covering substrate compatibility, coating size, drying methods, upscaling potential, and experimental setup.

This paper provides detailed insights into the development and characterization of the novel five-layer AR coating, including simulation, optical measurements, and abrasion testing, ...

Let's cut to the chase - when most people think photovoltaic panels, they imagine shiny silicon cells. But here's the gotcha: the substrate material underneath is like the bass player in a rock band.

Here we introduce a scalable fabrication strategy based on retreating the wet perovskite films with an in situ additive coating under continuous gas quenching.

Carbon nanomaterials are unique materials comprising desirable properties for the application in thin film solar cells making them potential material for photovoltaic application. This ...

This study investigates the effectiveness of oleic acid-functionalized Al₂O₃ nanoparticle thin-film coatings in reducing dust-induced performance losses in photovoltaic (PV) systems. Coating ...

This chapter summarizes the factors that should be considered when applying self-cleaning coatings to photovoltaic systems and the current application status of self-cleaning coatings ...
