

Abstract: Design a refrigeration system that uses solar photovoltaic cells as driving energy and semiconductor refrigeration chips as cooling sources.

By aligning cooling strategy with precision manufacturing, sustainability, and operational risk management goals, semiconductor fabs can achieve long-term performance and environmental ...

This review article compiles many studies that aim to improve the efficiency, coefficient of performance (COP), and decrease the power consumption of solar PV-powered refrigeration systems.

In this paper, we demonstrate a compact, chip-based device that allows for direct storage of solar energy as chemical energy that is released in the form of heat on demand and then ...

The invention relates to a solar electric power generation and refrigerating apparatus, wherein a paraboloid-shaped solar energy collector made of aluminum or alloy material is used to...

Through theoretical design, experimental fabrication, testing and other research methods, a solar driven cold and warm box suitable for outdoor environment is designed and manufactured with...

It meets the requirements of green environmental protection and has important strategic significance for the sustainable development of the national economy; Therefore, this article ...

On this basis, the component selection of solar semiconductor refrigeration system experimental platform, the design and construction of the system and its performance experiment are completed, ...

Can a solar-powered thermoelectric refrigeration system cool a refrigerator? This research aims to analyse the performance of a solar-powered thermoelectric refrigeration system.

Through the model experiment, the working current and power consumption as well as the refrigeration temperature control effect of the system were analyzed, and verified the feasibility of the system. ...
