

What is a 420 kV grid substation?

Fast deployable, independent grid substations up to 420 kV for Transmission System Operators are increasing the availability of energy transmission systems. The substation is designed for road transportation and dimensions of each unit meet local road transportation requirements.

What is an emergency generator?

Emergency generators are defined as backup power systems used in process industries to ensure the operation of vital and critical equipment during major incidents, requiring protection from fire and explosion hazards. Their capacity must accommodate all anticipated services during the worst case credible event (WCCE).

How many generators are there?

There are a total of four generators, out of which three continuously feed the busbars A, B, C, D & E in synchronization. One is the emergency diesel generator which normally remains off. Following nomenclature will be used for the elements of this power system. Also, power failure here would mean shutdown of both turbo and gas-driven units.

Can a diesel generator thwart a power shutdown?
