

The process of replacing bearings in a wind turbine is complex and requires meticulous planning and execution. Here is a detailed overview of the process in English.

A common challenge in wind turbine generator maintenance is bearing failure due to static discharges and lightning strikes. White-etching cracks (WEC) and other kinds of damage caused by electrical ...

The following article explains which components are typically affected, how a large component replacement works, what risks and planning requirements exist - and why this measure ...

Liebherr offers blade and yaw bearings as well as gearboxes as replacement components for a wide range of wind turbine types. Whether retrofitting, upgrading your turbine or extending the turbine life ...

This study seeks to establish a comprehensive baseline of knowledge for the replacement and damage of main bearings in wind turbines. The purpose of this report is to provide a high-level ...

Solving problems in Wind for 25 years We started in the Wind industry in 1998. We are now the premier solution provider for all WTG bearing applications in Wind.

The total cost of a main bearing replacement can be in the range of \$225,000-\$400,000, depending on the turbine model and wind plant location. Also, low availability of the proper main bearing for ...

Bearing replacement is inevitable over time, however, there is a more economical and sustainable option -- remanufacturing. We have previously explored the concept and its benefits, ...

SKF provided design verification support tool (DVST) sensors, which were installed in a GE 1.5-megawatt SLE turbine at NREL. We examine the axial and sliding motion, loads, and lubrication of ...
